**Chapter 0 - Intrauterine Insemination (IUI)** ..... 2

## **0 - Intrauterine Insemination (IUI)**

Despite revolutionary advances in the field of assisted fertility treatment like IVF, ICSI, and SUZI, Intrauterine Insemination (IUI) is the simplest, most effective, and cheapest approach to infertility treatment procedures that enables patients with various infertility problems to conceive. IUI overthrows other assisted reproductive treatments. It is an infertility treatment that assists the sperm in fertilizing the eggs. IUI is an inexpensive, noninvasive, and effective first-line assisted reproductive treatment. IUI is provided to patients with cervical factors, moderate male factors, unexplained infertility, immunological infertility, and infertility due to ejaculatory disorders. Today, IUI is also proposed as a therapy for endometriosis, ovarian dysfunction, and even for tubal factors. The Intrauterine Insemination (IUI) success rate is up to 65% in women between 21-35 years and males below 45 years. Fertilityworld team offers FREE IUI consultation and has been successful in giving positive results to thousands of patients.
